

Business Security in a Remote World

Solutions to protect your corporate data

1300 650 660

The past 18 months has been a challenging time for many people and organisations. Many companies are trying to figure out how they can enable their employees to continue working outside of a traditional office, without compromising security. Moving to the cloud allows your business to be agile to respond to these changing times.

We can help mobilise your team quickly and securely so you can be 'work ready' for when you must send your staff home.

If staff don't have the ability to use a managed corporate laptop/computer from home, they may be required to use their personal equipment to access business data posing major security risks:

- Is their computer patched?
- Do they have Anti-Virus and Anti-Malware installed?
- Who else has access to that device?
- Is there password protection?

If you can't confidently answer yes to all these questions there's a high chance your corporate data, staff identities and customer data is being compromised.

We can help mobilise your team quickly and securely so you can be 'work ready' for when you must send your staff home. And if they are already working from home, we can reduce your risk and simplify things for your business.

We have solutions that can provide:

- Secure access for staff to their corporate computer
- Restricted access to backdoors into your customer data providing enhanced risk mitigation
- Ability for staff to use their unmanaged home computer securely
- Multi factor authentication
- Limiting access only to the staff you need, with no contract
- Reduced risk of data breach/loss
- Simple and quick to deploy
